1 Introduction

1.1 Industrial robot documentation

The industrial robot documentation consists of the following parts:

- Documentation for the manipulator
- Documentation for the robot controller
- Operating and programming instructions for the System Software
- Instructions for options and accessories
- Parts catalog on storage medium

Each of these sets of instructions is a separate document.

1.2 Representation of warnings and notes

Safety

These warnings are relevant to safety and must be observed.

- **DANGER** These warnings mean that it is certain or highly probable that death or severe injuries will occur, if no precautions are taken.

- **WARNING** These warnings mean that death or severe injuries may occur, if no precautions are taken.

- **CAUTION** These warnings mean that minor injuries may occur, if no precautions are taken.

- **NOTICE** These warnings mean that damage to property may occur, if no precautions are taken.

These warnings contain references to safety-relevant information or general safety measures.

These warnings do not refer to individual hazards or individual precautionary measures.

This warning draws attention to procedures which serve to prevent or remedy emergencies or malfunctions:

- **SAFETY INSTRUCTIONS** The following procedure must be followed exactly!

Procedures marked with this warning must be followed exactly.

Notices

These notices serve to make your work easier or contain references to further information.

- **Tip** Tip to make your work easier or reference to further information.
2 Purpose

2.1 Target group

This documentation is aimed at users with the following knowledge and skills:

- Advanced knowledge of mechanical engineering
- Advanced knowledge of electrical and electronic systems
- Knowledge of the robot controller system

For optimal use of our products, we recommend that our customers take part in a course of training at KUKA College. Information about the training program can be found at www.kuka.com or can be obtained directly from our subsidiaries.

2.2 Intended use

Use

The industrial robot is intended for handling tools and fixtures or for processing and transferring components or products. Use is only permitted under the specified environmental conditions.

Misuse

Any use or application deviating from the intended use is deemed to be misuse and is not allowed. This includes e.g.:

- Use as a climbing aid
- Operation outside the specified operating parameters
- Operation without the required safety equipment

**NOTICE** Changing the structure of the robot, e.g. by drilling holes, can result in damage to the components. This is considered improper use and leads to loss of guarantee and liability entitlements.

**NOTICE** Deviations from the operating conditions specified in the technical data or the use of special functions or applications can lead to premature wear. KUKA Deutschland GmbH must be consulted.

⚠️ The robot system is an integral part of a complete system and may only be operated in a CE-compliant system.
3 Product description

3.1 Overview of the industrial robot

A robot system comprises all the assemblies of an industrial robot, including the manipulator (mechanical system and electrical installations), control cabinet, connecting cables, end effector (tool) and other equipment. The KR 1000 titan product family comprises the types:

- KR 1000 titan
- KR 1000 titan L750

The robots are also available as F variants.

The industrial robot consists of the following components:

- Manipulator
- Robot controller
- Teach pendant
- Connecting cables
- Software
- Options, accessories

3.2 Description of the robot

Overview

The robots are designed as 6-axis jointed-arm kinematic systems. The structural components of the robot are made of iron castings.

The robot consists of the following principal components:

- In-line wrist
- Arm
- Link arm
- Rotating column
- Base frame
Counterbalancing system
Electrical installations

In-line wrist
The robot is fitted with a 3-axis in-line wrist. The in-line wrist comprises axes 4, 5 and 6. It is driven by 3 motors installed at the rear end of the arm via connecting shafts. For attaching end effectors (tools), the in-line wrist has a mounting flange. The gear units of the in-line wrist are supplied with oil from 3 separate oil chambers. The robot can be equipped with an in-line wrist for a rated payload of 1000 kg or 750 kg, depending on the variant. The in-line wrist with a rated payload of 750 kg offers a longer reach of 400 mm. Both wrist variants are also available in foundry versions.

Arm
The arm is the link between the in-line wrist and the link arm. It houses the motors of the wrist axes A4, A5 and A6 and the motors of main axis A3. The arm is driven by the 2 motors of axis 3, which drive the gear unit between the arm and the link arm via an input stage. The maximum permissible swivel angle is mechanically limited by a stop for each direction, plus and minus. The associated buffers are attached to the arm.

If the robot is operated in the foundry version, a special arm variant is employed. This arm is pressurized via a pressure regulator with compressed air, which is supplied via a compressed air line.

Link arm
The link arm is the assembly located between the arm and the rotating column. It is mounted in the rotating column with a gear unit on each side and is driven by 2 motors. The two motors engage with an input stage before driving both gear units via a shaft.

Fig. 3-2: Principal components of the KR 1000 titan

1 In-line wrist 5 Rotating column
2 Arm 6 Base frame
3 Counterbalancing system 7 Link arm
4 Electrical installations
Rotating column  The rotating column houses the motors of axes 1 and 2. The rotational motion of axis 1 is performed by the rotating column. It is screwed to the base frame via the gear unit of axis 1. The motors for driving axis 1 are mounted inside the rotating column. The bearings of the counterbalancing system are situated at the rear.

Base frame  The base frame is the base of the robot. It is screwed to the mounting base. The interfaces for the electrical installations and the energy supply systems (accessory) are housed in the base frame. For transportation by fork lift truck, fork slots are provided on the base frame.

Counterbalancing system  The counterbalancing system is installed between the rotating column and the link arm and serves to minimize the moments generated about axis 2 when the robot is in motion and at rest. A closed, hydropneumatic system is used. The system consists of 2 diaphragm accumulators and a cylinder with associated hoses, pressure gauge and safety valve.

When the link arm is vertical, the counterbalancing system has no effect. With increasing deflection in the plus or minus direction, the hydraulic oil is pressed into the two diaphragm accumulators, thereby generating the necessary counterforce to compensate the moment of the axis. The diaphragm accumulators are filled with nitrogen.

Electrical installations  The electrical installations include all the motor and control cables for the motors of axes 1 to 6. All connections are implemented as connectors in order to enable the motors to be exchanged quickly and reliably. The electrical installations also include the RDC box and three multi-function housings (MFH). The RDC box and MFH with the connectors for the motor cables are mounted on the push-in module on the robot base frame. The connecting cables from the robot controller are connected here by means of connectors. The electrical installations also include the protective circuit.

Options  The robot can be fitted and operated with various options, such as energy supply systems for axes 1 to 3, energy supply systems for axes 3 to 6, or working range limitation systems. The options are described in separate documentation.
## 4 Technical data

<tr>
<td>Grip length</td>
<td>1.5 x nominal diameter</td>
</tr>
<tr>
<td>Depth of engagement</td>
<td>min. 24 mm, max. 25 mm</td>
</tr>
<tr>
<td>Locating element</td>
<td>12 H7</td>
</tr>
</tbody>
</table>

*The inner locating diameter is φ 160 H7. This deviates from the standard.

The mounting flange is depicted (>>> Fig. 4-5 ) with axes 4 and 6 in the zero position. The symbol X_m indicates the position of the locating element (bushing) in the zero position.
Supplementary load

The robot can carry supplementary loads on the arm. When mounting the supplementary loads, be careful to observe the maximum permissible total load. If an energy supply system A3 - A6 is used, the maximum supplementary load is reduced by the mass of the energy supply system. The dimensions and positions of the installation options can be seen in the diagram (Fig. 4-6). All other threads and holes on the robot are not suitable for attaching additional loads.
## 4.5 Payloads, KR 1000 L750 titan

### Payloads

| Robots                  | KR 1000 L750 titan  
|-------------------------|---------------------
|                         | KR 1000 L750 F titan|
| In-line wrist           | IW 750              |
| Rated payload           | 750 kg              |
| Distance of the load center of gravity \(L_z\) | 400 mm              |
| Distance of the load center of gravity \(L_{xy}\) | 450 mm              |
| Permissible moment of inertia | 375 kgm\(^2\)   |
| Max. total load         | 800 kg              |
| Supplementary load, arm | 100 kg              |
| Supplementary load, link arm | 0 kg          |
| Supplementary load, rotating column | 0 kg           |
| Supplementary load, base frame | 0 kg           |

### Load center of gravity \(P\)

For all payloads, the load center of gravity refers to the distance from the face of the mounting flange on axis 6. Refer to the payload diagram for the nominal distance.

### Payload diagram

**NOTICE** This loading curve corresponds to the maximum load capacity. Both values (payload and mass moment of inertia) must be checked in all cases. Exceeding this capacity will reduce the service life of the robot and overload the motors and the gears; in any such case KUKA Deutschland GmbH must be consulted beforehand.

The values determined here are necessary for planning the robot application. For commissioning the robot, additional input data are required in accordance with the operating and programming instructions of the KUKA System Software.

The mass inertia must be verified using KUKA.Load. It is imperative for the load data to be entered in the robot controller!
Mounting flange

<table>
<thead>
<tr>
<th>Description</th>
<th>Specification</th>
</tr>
</thead>
<tbody>

<td>1.5 x nominal diameter</td>
</tr>
<tr>
<td>Depth of engagement</td>
<td>min. 24 mm, max. 25 mm</td>
</tr>
<tr>
<td>Locating element</td>
<td>12 H7</td>
</tr>
</tbody>
</table>

*The inner locating diameter is $\varnothing 160$ H7. This deviates from the standard.

The mounting flange is depicted (>>> Fig. 4-8 ) with axes 4 and 6 in the zero position. The symbol $X_m$ indicates the position of the locating element (bushing) in the zero position.
Supplementary load

The robot can carry supplementary loads on the arm. When mounting the supplementary loads, be careful to observe the maximum permissible total load. If an energy supply system A3 - A6 is used, the maximum supplementary load is reduced by the mass of the energy supply system. The dimensions and positions of the installation options can be seen in the diagram (Fig. 4-9). All other threads and holes on the robot are not suitable for attaching additional loads.

Fig. 4-8: Mounting flange

Fig. 4-9: Supplementary load, arm
### 4.6 Foundation data

#### Foundation loads

The specified forces and moments already include the payload and the inertia force (weight) of the robot.

#### Table: Type of load and Force/torque/mass

<table>
<thead>
<tr>
<th>Type of load</th>

| \( M_r \) = torque            | \( M_{r \text{ normal}} = 36,600 \text{ Nm} \)  
\( M_{r \text{ max}} = 99,700 \text{ Nm} \) |
| Total mass for foundation load | 6,000 kg                      |

Robot

| KR 1000 titan, 4,690 kg |
| KR 1000 F titan, 4,700 kg |
| KR 1000 L750 titan, 4,740 kg |
| KR 1000 L750 titan F, 4,750 kg |

Total load for foundation load

| 1,050 kg for KR 1000 titan  |
| 800 kg for KR 1000 L750 titan |
### Grade of concrete for foundations

When producing foundations from concrete, observe the load-bearing capacity of the ground and the country-specific construction regulations. There must be no layers of insulation or screed between the bedplate/bedplates and the concrete foundation. The quality of the concrete must meet the requirements of the following standard:

### 4.7 Plates and labels

#### Plates and labels

The following plates and labels are attached to the robot. They must not be removed or rendered illegible. Illegible plates and labels must be replaced.

![Location of plates and labels](image)

<table>

Art.Nr. 90–150–847
4.8 REACH duty to communicate information acc. to Art. 33 of Regulation (EC) 1907/2006

On the basis of the information provided by our suppliers, this product and its components contain no substances included on the "Candidate List" of Substances of Very High Concern (SVHCs) in a concentration exceeding 0.1 percent by mass.

4.9 Stopping distances and times

4.9.1 General information

Information concerning the data:

- The stopping distance is the angle traveled by the robot from the moment the stop signal is triggered until the robot comes to a complete standstill.
- The stopping time is the time that elapses from the moment the stop signal is triggered until the robot comes to a complete standstill.
- The data are given for the main axes A1, A2 and A3. The main axes are the axes with the greatest deflection.
- Superposed axis motions can result in longer stopping distances.
4 Technical data

- Stopping distances and stopping times in accordance with DIN EN ISO 10218-1, Annex B.
- Stop categories:
  - Stop category 0 » STOP 0
  - Stop category 1 » STOP 1
    according to IEC 60204-1
- The values specified for Stop 0 are guide values determined by means of tests and simulation. They are average values which conform to the requirements of DIN EN ISO 10218-1. The actual stopping distances and stopping times may differ due to internal and external influences on the braking torque. It is therefore advisable to determine the exact stopping distances and stopping times where necessary under the real conditions of the actual robot application.
- Measuring technique
  The stopping distances were measured using the robot-internal measuring technique.
- The wear on the brakes varies depending on the operating mode, robot application and the number of STOP 0 stops triggered. It is therefore advisable to check the stopping distance at least once a year.

5 Safety

5.1 General

The device described in this document is either an industrial robot or a component thereof.

Components of the industrial robot:

- Manipulator
- Robot controller
- Teach pendant
- Connecting cables
- External axes (optional)
  - e.g. linear unit, turn-tilt table, positioner
- Software
- Options, accessories

The industrial robot is built using state-of-the-art technology and in accordance with the recognized safety rules. Nevertheless, misuse of the industrial robot may constitute a risk to life and limb or cause damage to the industrial robot and to other material property.

The industrial robot may only be used in perfect technical condition in accordance with its designated use and only by safety-conscious persons who are fully aware of the risks involved in its operation. Use of the industrial robot is subject to compliance with this document and with the declaration of incorporation supplied together with the industrial robot. Any functional disorders affecting safety must be rectified immediately.

Information about safety may not be construed against KUKA Deutschland GmbH. Even if all safety instructions are followed, this is not a guarantee that the industrial robot will not cause personal injuries or material damage.

No modifications may be carried out to the industrial robot without the authorization of KUKA Deutschland GmbH. Additional components (tools, software, etc.), not supplied by KUKA Deutschland GmbH, may be integrated into the industrial robot. The user is liable for any damage these components may cause to the industrial robot or to other material property.

In addition to the Safety chapter, this document contains further safety instructions. These must also be observed.
5.1.2 Intended use of the industrial robot

The industrial robot is intended exclusively for the use designated in the “Purpose” chapter of the operating instructions or assembly instructions. Any use or application deviating from the intended use is deemed to be misuse and is not allowed. The manufacturer is not liable for any damage resulting from such misuse. The risk lies entirely with the user.

Operation of the industrial robot in accordance with its intended use also requires compliance with the operating and assembly instructions for the individual components, with particular reference to the maintenance specifications.

Misuse

Any use or application deviating from the intended use is deemed to be misuse and is not allowed. This includes e.g.:

- Use as a climbing aid
- Operation outside the specified operating parameters
- Operation without the required safety equipment

5.1.3 EC declaration of conformity and declaration of incorporation

The industrial robot constitutes partly completed machinery as defined by the EC Machinery Directive. The industrial robot may only be put into operation if the following preconditions are met:

- The industrial robot is integrated into a complete system.
  - or: The industrial robot, together with other machinery, constitutes a complete system.
  - or: All safety functions and safeguards required for operation in the complete machine as defined by the EC Machinery Directive have been added to the industrial robot.
- The complete system complies with the EC Machinery Directive. This has been confirmed by means of a conformity assessment procedure.

EC declaration of conformity

The system integrator must issue an EC declaration of conformity for the complete system in accordance with the Machinery Directive. The EC declaration of conformity forms the basis for the CE mark for the system. The industrial robot must always be operated in accordance with the applicable national laws, regulations and standards.

The robot controller has a CE mark in accordance with the EMC Directive and the Low Voltage Directive.

Declaration of incorporation

The partly completed machinery is supplied with a declaration of incorporation in accordance with Annex II B of the EC Machinery Directive 2006/42/EC. The assembly instructions and a list of essential requirements complied with in accordance with Annex I are integral parts of this declaration of incorporation.

The declaration of incorporation declares that the start-up of the partly completed machinery is not allowed until the partly completed machinery has been incorporated into machinery, or has been assembled with other parts to form machinery, and this machinery complies with the terms of the EC Machinery Directive, and the EC declaration of conformity is present in accordance with Annex II A.
### 5.1.4 Terms used

<table>

</tr>
<tr>
<td></td>
<td>Example: SafeOperation</td>
</tr>
<tr>
<td>smartPAD</td>
<td>Teach pendant for the KR C4</td>
</tr>
<tr>
<td></td>
<td>The smartPAD has all the operator control and display functions required for operating and programming the industrial robot.</td>
</tr>
<tr>
<td>Stop category 0</td>
<td>The drives are deactivated immediately and the brakes are applied. The manipulator and any external axes (optional) perform path-oriented braking.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This stop category is called STOP 0 in this document.</td>
</tr>
<tr>
<td>Stop category 1</td>
<td>The manipulator and any external axes (optional) perform path-main-taining braking. The drives are deactivated after 1 s and the brakes are applied.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This stop category is called STOP 1 in this document.</td>
</tr>
<tr>
<td>Stop category 2</td>
<td>The drives are not deactivated and the brakes are not applied. The manipulator and any external axes (optional) are braked with a normal braking ramp.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This stop category is called STOP 2 in this document.</td>
</tr>
<tr>
<td>System integrator (plant integrator)</td>
<td>System integrators are people who safely integrate the industrial robot into a complete system and commission it.</td>
</tr>
<tr>
<td>T1</td>
<td>Test mode, Manual Reduced Velocity (&lt;= 250 mm/s)</td>
</tr>
<tr>
<td>T2</td>
<td>Test mode, Manual High Velocity (&gt; 250 mm/s permissible)</td>
</tr>
<tr>
<td>External axis</td>
<td>Axis of motion that does not belong to the manipulator, yet is controlled with the same controller. e.g. KUKA linear unit, turn-tilt table, Posiflex</td>
</tr>
</tbody>
</table>
5.2 Personnel

The following persons or groups of persons are defined for the industrial robot:

- User
- Personnel

All persons working with the industrial robot must have read and understood the industrial robot documentation, including the safety chapter.

User

The user must observe the labor laws and regulations. This includes e.g.:

- The user must comply with his monitoring obligations.
- The user must carry out briefing at defined intervals.

Personnel

Personnel must be instructed, before any work is commenced, in the type of work involved and what exactly it entails as well as any hazards which may exist. Instruction must be carried out regularly. Instruction is also required after particular incidents or technical modifications.

Personnel includes:

- System integrator
- Operators, subdivided into:
  - Start-up, maintenance and service personnel
  - Operating personnel
  - Cleaning personnel

Installation, exchange, adjustment, operation, maintenance and repair must be performed only as specified in the operating or assembly instructions for the relevant component of the industrial robot and only by personnel specially trained for this purpose.

System integrator

The industrial robot is safely integrated into a complete system by the system integrator.

The system integrator is responsible for the following tasks:

- Installing the industrial robot
- Connecting the industrial robot
- Performing risk assessment
- Implementing the required safety functions and safeguards
- Issuing the EC declaration of conformity
- Attaching the CE mark
- Creating the operating instructions for the system

Operators

The operator must meet the following preconditions:

- The operator must be trained for the work to be carried out.
- Work on the system must only be carried out by qualified personnel. These are people who, due to their specialist training, knowledge and experience, and their familiarization with the relevant standards, are able to assess the work to be carried out and detect any potential hazards.

Work on the electrical and mechanical equipment of the industrial robot may only be carried out by specially trained personnel.
5.3 **Workspace, safety zone and danger zone**

Workspaces are to be restricted to the necessary minimum size. A workspace must be safeguarded using appropriate safeguards. The safeguards (e.g. safety gate) must be situated inside the safety zone. In the case of a stop, the manipulator and external axes (optional) are braked and come to a stop within the danger zone.

The danger zone consists of the workspace and the stopping distances of the manipulator and external axes (optional). It must be safeguarded by means of physical safeguards to prevent danger to persons or the risk of material damage.

5.4 **Overview of protective equipment**

The protective equipment of the mechanical component may include:

- Mechanical end stops
- Mechanical axis limitation (optional)
- Release device (optional)
- Brake release device (optional)
- Labeling of danger areas

Not all equipment is relevant for every mechanical component.

5.4.1 **Mechanical end stops**

Depending on the robot variant, the axis ranges of the main and wrist axes of the manipulator are partially limited by mechanical end stops.

Additional mechanical end stops can be installed on the external axes.

![WARNING]

If the manipulator or an external axis hits an obstruction or a mechanical end stop or mechanical axis limitation, the manipulator can no longer be operated safely. The manipulator must be taken out of operation and KUKA Deutschland GmbH must be consulted before it is put back into operation.

5.4.2 **Mechanical axis limitation (optional)**

Some manipulators can be fitted with mechanical axis limitation systems in axes A1 to A3. The axis limitation systems restrict the working range to the required minimum. This increases personal safety and protection of the system.

In the case of manipulators that are not designed to be fitted with mechanical axis limitation, the workspace must be laid out in such a way that there is no danger to persons or material property, even in the absence of mechanical axis limitation.

If this is not possible, the workspace must be limited by means of photoelectric barriers, photoelectric curtains or obstacles on the system side. There must be no shearing or crushing hazards at the loading and transfer areas.

![This option is not available for all robot models. Information on specific robot models can be obtained from KUKA Deutschland GmbH.]
5.4.3 Options for moving the manipulator without drive energy

The system user is responsible for ensuring that the training of personnel with regard to the response to emergencies or exceptional situations also includes how the manipulator can be moved without drive energy.

**Description**

The following options are available for moving the manipulator without drive energy after an accident or malfunction:

- **Release device (optional)**
  The release device can be used for the main axis drive motors and, depending on the robot variant, also for the wrist axis drive motors.

- **Brake release device (option)**
  The brake release device is designed for robot variants whose motors are not freely accessible.

- **Moving the wrist axes directly by hand**
  There is no release device available for the wrist axes of variants in the low payload category. This is not necessary because the wrist axes can be moved directly by hand.

---

**NOTICE**

Moving the manipulator without drive energy can damage the motor brakes of the axes concerned. The motor must be replaced if the brake has been damaged. The manipulator may therefore be moved without drive energy only in emergencies, e.g. for rescuing persons.

---

5.4.4 Labeling on the industrial robot

All plates, labels, symbols and marks constitute safety-relevant parts of the industrial robot. They must not be modified or removed.

Labeling on the industrial robot consists of:

- Identification plates
- Warning signs
- Safety symbols
- Designation labels
- Cable markings
- Rating plates

Further information is contained in the technical data of the operating instructions or assembly instructions of the components of the industrial robot.
5 Safety

5.5 Safety measures

5.5.1 General safety measures

The industrial robot may only be used in perfect technical condition in accordance with its intended use and only by safety-conscious persons. Operator errors can result in personal injury and damage to property.

It is important to be prepared for possible movements of the industrial robot even after the robot controller has been switched off and locked out. Incorrect installation (e.g. overload) or mechanical defects (e.g. brake defect) can cause the manipulator or external axes to sag. If work is to be carried out on a switched-off industrial robot, the manipulator and external axes must first be moved into a position in which they are unable to move on their own, whether the payload is mounted or not. If this is not possible, the manipulator and external axes must be secured by appropriate means.

In the absence of operational safety functions and safeguards, the industrial robot can cause personal injury or material damage. If safety functions or safeguards are dismantled or deactivated, the industrial robot may not be operated.

Standing underneath the robot arm can cause death or injuries. For this reason, standing underneath the robot arm is prohibited!

The motors reach temperatures during operation which can cause burns to the skin. Contact must be avoided. Appropriate safety precautions must be taken, e.g. protective gloves must be worn.

The user must ensure that the industrial robot is only operated with the KCP/smartPAD by authorized persons.

If more than one KCP/smartPAD is used in the overall system, it must be ensured that each device is unambiguously assigned to the corresponding industrial robot. They must not be interchanged.

The operator must ensure that decoupled KCPs/smartPADs are immediately removed from the system and stored out of sight and reach of personnel working on the industrial robot. This serves to prevent operational and non-operational EMERGENCY STOP devices from becoming interchanged. Failure to observe this precaution may result in death, severe injuries or considerable damage to property.

An external keyboard and/or external mouse may only be used if the following conditions are met:

- Start-up or maintenance work is being carried out.
- The drives are switched off.
- There are no persons in the danger zone.

The KCP/smartPAD must not be used as long as an external keyboard and/or external mouse are connected to the control cabinet.

The external keyboard and/or external mouse must be removed from the control cabinet as soon as the start-up or maintenance work is completed or the KCP/smartPAD is connected.
Modifications

After modifications to the industrial robot, checks must be carried out to ensure the required safety level. The valid national or regional work safety regulations must be observed for this check. The correct functioning of all safety functions must also be tested.

New or modified programs must always be tested first in Manual Reduced Velocity mode (T1).

After modifications to the industrial robot, existing programs must always be tested first in Manual Reduced Velocity mode (T1). This applies to all components of the industrial robot and includes e.g. modifications of the external axes or to the software and configuration settings.

Faults

The following tasks must be carried out in the case of faults in the industrial robot:

- Switch off the robot controller and secure it (e.g. with a padlock) to prevent unauthorized persons from switching it on again.
- Indicate the fault by means of a label with a corresponding warning (tag-out).
- Keep a record of the faults.
- Eliminate the fault and carry out a function test.

5.5.2 Transportation

Manipulator

The prescribed transport position of the manipulator must be observed. Transportation must be carried out in accordance with the operating instructions or assembly instructions of the robot.

Avoid vibrations and impacts during transportation in order to prevent damage to the manipulator.

Robot controller

The prescribed transport position of the robot controller must be observed. Transportation must be carried out in accordance with the operating instructions or assembly instructions of the robot controller.

Avoid vibrations and impacts during transportation in order to prevent damage to the robot controller.

External axis (optional)

The prescribed transport position of the external axis (e.g. KUKA linear unit, turn-tilt table, positioner) must be observed. Transportation must be carried out in accordance with the operating instructions or assembly instructions of the external axis.

5.5.3 Start-up and recommissioning

Before starting up systems and devices for the first time, a check must be carried out to ensure that the systems and devices are complete and operational, that they can be operated safely and that any damage is detected.

The valid national or regional work safety regulations must be observed for this check. The correct functioning of all safety circuits must also be tested.

The passwords for logging onto the KUKA System Software as “Expert” and “Administrator” must be changed before start-up and must only be communicated to authorized personnel.
Function test

The following tests must be carried out before start-up and recommissioning:

- The industrial robot is correctly installed and fastened in accordance with the specifications in the documentation.
- There is no damage to the robot that could be attributed to external forces. Example: Dents or abrasion that could be caused by an impact or collision.
- There are no foreign bodies or loose parts on the industrial robot.
- All required safety equipment is correctly installed and operational.
- The power supply ratings of the industrial robot correspond to the local supply voltage and mains type.
- The ground conductor and the equipotential bonding cable are sufficiently rated and correctly connected.
- The connecting cables are correctly connected and the connectors are locked.

**WARNING**

The robot controller is preconfigured for the specific industrial robot. If cables are interchanged, the manipulator and the external axes (optional) may receive incorrect data and can thus cause personal injury or material damage. If a system consists of more than one manipulator, always connect the connecting cables to the manipulators and their corresponding robot controllers.

**NOTICE**

If additional components (e.g. cables), which are not part of the scope of supply of KUKA Deutschland GmbH, are integrated into the industrial robot, the user is responsible for ensuring that these components do not adversely affect or disable safety functions.

**NOTICE**

If the internal cabinet temperature of the robot controller differs greatly from the ambient temperature, condensation can form, which may cause damage to the electrical components. Do not put the robot controller into operation until the internal temperature of the cabinet has adjusted to the ambient temperature.

### 5.5.4 Manual mode

Manual mode is the mode for setup work. Setup work is all the tasks that have to be carried out on the industrial robot to enable automatic operation. Setup work includes:

- Jog mode
- Teaching
- Programming
- Program verification

The following must be taken into consideration in manual mode:

- If the drives are not required, they must be switched off to prevent the manipulator or the external axes (optional) from being moved unintentionally.
- New or modified programs must always be tested first in Manual Reduced Velocity mode (T1).
- The manipulator, tooling or external axes (optional) must never touch or project beyond the safety fence.
- Workpieces, tooling and other objects must not become jammed as a result of the industrial robot motion, nor must they lead to short-circuits or be liable to fall off.
- All setup work must be carried out, where possible, from outside the safeguarded area.

If the setup work has to be carried out inside the safeguarded area, the following must be taken into consideration:

In **Manual Reduced Velocity mode (T1)**:

- If it can be avoided, there must be no other persons inside the safeguarded area.
- If it is necessary for there to be several persons inside the safeguarded area, the following must be observed:
  - Each person must have an enabling device.
  - All persons must have an unimpeded view of the industrial robot.
  - Eye-contact between all persons must be possible at all times.
- The operator must be so positioned that he can see into the danger area and get out of harm’s way.

In **Manual High Velocity mode (T2)**:

- This mode may only be used if the application requires a test at a velocity higher than possible in T1 mode.
- Teaching and programming are not permissible in this operating mode.
- Before commencing the test, the operator must ensure that the enabling devices are operational.
- The operator must be positioned outside the danger zone.
- There must be no other persons inside the safeguarded area. It is the responsibility of the operator to ensure this.

### 5.5.5 Automatic mode

Automatic mode is only permissible in compliance with the following safety measures:

- All safety equipment and safeguards are present and operational.
- There are no persons in the system.
- The defined working procedures are adhered to.

If the manipulator or an external axis (optional) comes to a standstill for no apparent reason, the danger zone must not be entered until an EMERGENCY STOP has been triggered.

### 5.5.6 Maintenance and repair

After maintenance and repair work, checks must be carried out to ensure the required safety level. The valid national or regional work safety regulations must be observed for this check. The correct functioning of all safety functions must also be tested.

The purpose of maintenance and repair work is to ensure that the system is kept operational or, in the event of a fault, to return the system to an operational state. Repair work includes troubleshooting in addition to the actual repair itself.
The following safety measures must be carried out when working on the industrial robot:

- Carry out work outside the danger zone. If work inside the danger zone is necessary, the user must define additional safety measures to ensure the safe protection of personnel.

- Switch off the industrial robot and secure it (e.g. with a padlock) to prevent it from being switched on again. If it is necessary to carry out work with the robot controller switched on, the user must define additional safety measures to ensure the safe protection of personnel.

- If it is necessary to carry out work with the robot controller switched on, this may only be done in operating mode T1.

- Label the system with a sign indicating that work is in progress. This sign must remain in place, even during temporary interruptions to the work.

- The EMERGENCY STOP devices must remain active. If safety functions or safeguards are deactivated during maintenance or repair work, they must be reactivated immediately after the work is completed.

Faulty components must be replaced using new components with the same article numbers or equivalent components approved by KUKA Deutschland GmbH for this purpose.

Cleaning and preventive maintenance work is to be carried out in accordance with the operating instructions.

**Robot controller**

Even when the robot controller is switched off, parts connected to peripheral devices may still carry voltage. The external power sources must therefore be switched off if work is to be carried out on the robot controller.

The ESD regulations must be adhered to when working on components in the robot controller.

Voltages in excess of 50 V (up to 600 V) can be present in various components for several minutes after the robot controller has been switched off! To prevent life-threatening injuries, no work may be carried out on the industrial robot in this time.

Water and dust must be prevented from entering the robot controller.

**Counterbalancing system**

Some robot variants are equipped with a hydropneumatic, spring or gas cylinder counterbalancing system.

The hydropneumatic and gas cylinder counterbalancing systems are pressure equipment and, as such, are subject to obligatory equipment monitoring and the provisions of the Pressure Equipment Directive.

The user must comply with the applicable national laws, regulations and standards pertaining to pressure equipment.

Inspection intervals in Germany in accordance with Industrial Safety Order, Sections 14 and 15. Inspection by the user before commissioning at the installation site.

The following safety measures must be carried out when working on the counterbalancing system:
The manipulator assemblies supported by the counterbalancing systems must be secured.

Work on the counterbalancing systems must only be carried out by qualified personnel.

**Hazardous substances**

The following safety measures must be carried out when handling hazardous substances:

- Avoid prolonged and repeated intensive contact with the skin.
- Avoid breathing in oil spray or vapors.
- Clean skin and apply skin cream.

To ensure safe use of our products, we recommend regularly requesting up-to-date safety data sheets for hazardous substances.

### 5.5.7 Decommissioning, storage and disposal

The industrial robot must be decommissioned, stored and disposed of in accordance with the applicable national laws, regulations and standards.

### 5.6 Applied norms and regulations

6 Planning

6.1 Information for planning

In the planning and design phase, care must be taken regarding the functions or applications to be executed by the kinematic system. The following conditions can lead to premature wear. They necessitate shorter maintenance intervals and/or earlier exchange of components. In addition, the permissible operating parameters specified in the technical data must be taken into account and observed during planning.

- Continuous operation near temperature limits or in abrasive environments
- Continuous operation close to the performance limits, e.g. high rpm of an axis
- High duty cycle of individual axes
- Monotonous motion profiles, e.g. short, frequently recurring axis motions
- Static axis positions, e.g. continuous vertical position of a wrist axis
- External forces (process forces) acting on the robot

If one or more of these conditions are to apply during operation of the kinematic system, KUKA Deutschland GmbH must be consulted.

If the robot reaches its corresponding operation limit or if it is operated near the limit for a period of time, the built-in monitoring functions come into effect and the robot is automatically switched off.

This protective function can limit the availability of the robot system.

6.2 Mounting base with centering

Description

The mounting base with centering is used when the robot is fastened to the floor.

The mounting base with centering consists of:

- Bedplate
- Resin-bonded anchors (chemical anchors)
- Fastening elements

This mounting variant requires a level and smooth surface on a concrete foundation with adequate load bearing capacity. The concrete foundation must be able to accommodate the forces occurring during operation. There must be no layers of insulation or screed between the bedplate and the concrete foundation.

The minimum dimensions must be observed.
When producing foundations from concrete, observe the load-bearing capacity of the ground and the country-specific construction regulations. There must be no layers of insulation or screed between the bedplate/bedplates and the concrete foundation. The quality of the concrete must meet the requirements of the following standard:

The following illustration (Fig. 6-2) provides all the necessary information on the mounting base, together with the required foundation data.

**Fig. 6-1: Mounting base**

1. Bedplate
2. Sword pin
3. Hexagon bolt with conical spring washer
4. Centering pin
5. Resin-bonded anchor
6. Concrete foundation
To ensure that the anchor forces are safely transmitted to the foundation, observe the dimensions for concrete foundations specified in the following illustration (Fig. 6-3).

**Fig. 6-2: Mounting base with centering, dimensioned drawing**

1 Resin-bonded anchor
2 Bedplate
3 Concrete foundation
6.3 Machine frame mounting

Description
The machine frame mounting assembly is used when the robot is fastened on a steel structure, a booster frame (pedestal) or a KUKA linear unit. It must be ensured that the substructure is able to withstand safely the forces occurring during operation (foundation loads). The following diagram contains all the necessary information that must be observed when preparing the mounting surface.

The machine frame mounting assembly consists of (Fig. 6-4):
- Centering pin with fasteners
- Sword pin with fasteners
- Hexagon bolts with conical spring washers

![Fig. 6-4: Machine frame mounting](image)

1 Hexagon bolt (12x) 3 Centering pin
2 Sword pin

Dimensioned drawing
The following illustration (Fig. 6-2) provides all the necessary information on the mounting base, together with the required foundation data.
6.4 Connecting cables and interfaces

The connecting cables comprise all the cables for transferring energy and signals between the robot and the robot controller. They are connected to the robot push-in module via multi-function housings (MFH) with connectors. The set of connecting cables comprises:

- Motor cable X20.1 - X30.1
- Motor cable X20.2 - X30.2
- Motor cable X20.3 - X30.3
- Data cable X21 - X31
- Ground conductor (optional)

Depending on the installation of the robot, various connecting cable lengths are used. Cable lengths of 15 m, 25 m, 35 m and 50 m are available. The maximum length of the connecting cables must not exceed 50 m. Thus if the robot is operated on a linear unit which has its own energy supply chain these cables must also be taken into account.

For the connecting cables, an additional ground conductor is always required to provide a low-resistance connection between the robotic system and the control cabinet in accordance with DIN EN 60204. The ground conductor is not included in the scope of supply. The ground conductors are connected with ring cable lugs via threaded bolts. The threaded bolt for connecting the ground conductor is located on the base frame of the robot.

The following points must be observed when planning and routing the connecting cables:

- The bending radius for fixed routing must not be less than 150 mm for motor cables and 60 mm for control cables.
- Protect cables against exposure to mechanical stress.
- Route the cables without mechanical stress – no tensile forces on the connectors
- Cables are only to be installed indoors.
- Observe the permissible temperature range (fixed installation) of 263 K (-10 °C) to 343 K (+70 °C).
- Route the motor cables and the data cables separately in metal ducts; if necessary, additional measures must be taken to ensure electromagnetic compatibility (EMC).

The robot can be equipped with an energy supply system between axis 1 and axis 3 and a second energy supply system between axis 3 and axis 6. The A1 interface required for this is located on the rear of the base frame, the A3 interface is located on the side of the arm and the interface for axis 6 is located on the robot tool. Depending on the application, the interfaces differ in design and scope. They can be equipped e.g. with connections for cables and hoses. Detailed information on the connector pin allocation, threaded unions, etc. is given in separate documentation.

**Interface for energy supply systems**

![Diagram of Interface A1]

2. Interface, axis 1, base frame
3. Connection, data cable, X31
Fig. 6-7: Interface A3

1. Connection, motor cable, X30
2. Interface, axis 1, base frame
3. Connection, data cable, X31
7  Transportation

7.1  Transporting the robot

Before transporting the robot, always move the robot into its transport position (Fig. 7-1). It must be ensured that the robot is stable while it is being transported. The robot must remain in its transport position until it has been fastened in position. Before the robot is lifted, it must be ensured that it is free from obstructions. Remove all transport safeguards, such as nails and screws, in advance. First remove any rust or glue on contact surfaces.

If the robot is sent via airfreight, the counterbalancing system must be fully depressurized (both oil and nitrogen).

A hydropneumatic counterbalancing system is classified as hazardous. For this reason, the applicable national regulations must be observed when shipping. If the robot with built-in counterbalancing system is, for example, shipped via airfreight, country regulations may require that the counterbalancing system be fully depressurized.

The robot must be in the transport position (Fig. 7-1) before it can be transported. The robot is in the transport position when the axes are in the following positions:

<table>
<thead>
<tr>
<th>Axis</th>
<th>A1</th>
<th>A2</th>
<th>A3</th>
<th>A4</th>
<th>A5</th>
<th>A6</th>
</tr>
</thead>
<tbody>

<td>0°</td>
<td>+90°</td>
<td>0°</td>
</tr>
</tbody>
</table>

1) Robot with buffer installed on axis 2
2) Robot without buffer on 2

The transport dimensions (Fig. 7-2) and (Fig. 7-3) for the robot can be noted from the following diagrams. The position of the center of gravity and the weight vary according to the specific configuration and the position of axis 2. The specified dimensions refer to the robot without equipment.

The dimensions with the index 1) apply for normal transportation. The dimensions with the index 2) are obtained if the buffer on the minus side of axis 2 is removed.
Transportation

The robot can be transported by fork lift truck or using lifting tackle.

Fig. 7-2: Transport dimensions with in-line wrist IW 1000

1. Robot
2. Fork slots
3. Center of gravity

Fig. 7-3: Transport dimensions with in-line wrist IW 750

1. Robot
2. Fork slots
3. Center of gravity
Transportation by fork lift truck

For transport by fork lift truck (Fig. 7-4), cast fork slots are provided in the base frame. The fork lift truck must have a minimum payload capacity of 6 t.

Transportation with lifting tackle

The robot can also be transported using lifting tackle. The robot must be in the transport position. The lifting tackle is attached to 3 eyebolts that are securely screwed into the rotating column. All the legs must be routed as shown in the following illustration so that the robot is not damaged. Installed tools and items of equipment can cause undesirable shifts in the center of gravity. Items of equipment, especially energy supply systems, must be removed to the extent necessary to avoid them being damaged by the legs of the lifting tackle during transportation.

All legs are labeled from “G1” to “G3”.

WARNING
Use of unsuitable handling equipment may result in damage to the robot or injury to persons. Only use authorized handling equipment with a sufficient load-bearing capacity. Only transport the robot in the manner specified here.

NOTICE
Avoid excessive loading of the fork slots through undue inward or outward movement of hydraulically adjustable forks of the fork lift truck. Failure to do so may result in material damage.

Fig. 7-4: Transportation by fork lift truck

The robot may tip during transportation. Risk of personal injury and damage to property.

If the robot is being transported using lifting tackle, special care must be exercised to prevent it from tipping. Additional safeguarding measures must be taken. It is forbidden to pick up the robot in any other way using a crane!

If the robot is equipped with remote junction boxes, the robot can also be transported by crane. Minor shifts in the center of gravity are to be expected.
Transportation with transport frame

If the permitted height for transportation is exceeded in the transport position, the robot can be moved into a different position. To do this, the robot must be secured to the transport frame with all holding-down bolts. Once this has been done, axes 2 and 3 can be moved so as to reduce the overall height (Fig. 7-6) and (Fig. 7-7). The robot can be transported on the transport frame by crane or fork lift truck (minimum payload capacity 8,000 kg). Both robot variants, with transport frame and without equipment, have an overall weight of approx. 5,600 kg.

Before the robot can be transported on the transport frame, the robot axes must be in the following positions:

<table>
<thead>
<tr>
<th>Axis</th>
<th>A 1</th>
<th>A 2</th>
<th>A 3</th>
<th>A 4</th>

8 KUKA Service

8.1 Requesting support

Introduction This documentation provides information on operation and operator control, and provides assistance with troubleshooting. For further assistance, please contact your local KUKA subsidiary.

Information The following information is required for processing a support request:

- Description of the problem, including information about the duration and frequency of the fault
- As comprehensive information as possible about the hardware and software components of the overall system

The following list gives an indication of the information which is relevant in many cases:

- Model and serial number of the kinematic system, e.g. the manipulator
- Model and serial number of the controller
- Model and serial number of the energy supply system
- Designation and version of the system software
- Designations and versions of other software components or modifications
- Diagnostic package KRCDiag
  - Additionally for KUKA Sunrise: Existing projects including applications
  - For versions of KUKA System Software older than V8: Archive of the software (KRCDiag is not yet available here.)

- Application used
- External axes used
