This documentation or excerpts therefrom may not be reproduced or disclosed to third parties without the express permission of KUKA Deutschland GmbH.

Other functions not described in this documentation may be operable in the controller. The user has no claims to these functions, however, in the case of a replacement or service work.

We have checked the content of this documentation for conformity with the hardware and software described. Nevertheless, discrepancies cannot be precluded, for which reason we are not able to guarantee total conformity. The information in this documentation is checked on a regular basis, however, and necessary corrections will be incorporated in the subsequent edition.

Subject to technical alterations without an effect on the function.

1 Introduction

1.1 Documentation of the industrial robot

The industrial robot documentation consists of the following parts:

- Documentation for the robot arm
- Documentation for the robot controller
- Operating and programming instructions for the System Software
- Instructions for options and accessories
- Parts catalog on storage medium

Each of these sets of instructions is a separate document.

1.2 Representation of warnings and notes

Safety

These warnings are provided for safety purposes and must be observed.

DANGER

These warnings mean that it is certain or highly probable that death or severe injuries will occur, if no precautions are taken.

WARNING

These warnings mean that death or severe injuries may occur, if no precautions are taken.

CAUTION

These warnings mean that minor injuries may occur, if no precautions are taken.

NOTICE

These warnings mean that damage to property may occur, if no precautions are taken.

These warnings contain references to safety-relevant information or general safety measures. These warnings do not refer to individual hazards or individual precautionary measures.

This warning draws attention to procedures which serve to prevent or remedy emergencies or malfunctions:

SAFETY INSTRUCTION

The following procedure must be followed exactly!

Procedures marked with this warning must be followed exactly.

Notices

These notices serve to make your work easier or contain references to further information.

Tip to make your work easier or reference to further information.

</tbody>
</table>
2 Purpose

2.1 Target group

This documentation is aimed at users with the following knowledge and skills:

- Advanced knowledge of mechanical engineering
- Advanced knowledge of electrical engineering
- Knowledge of the robot controller system

For optimal use of our products, we recommend that our customers take part in a course of training at KUKA College. Information about the training program can be found at www.kuka.com or can be obtained directly from our subsidiaries.

2.2 Intended use

Use

The industrial robot is intended for handling tools and fixtures, or for processing or transferring components or products in a cleanroom environment that is only monitored for particulate contamination. Use is only permitted under the specified environmental conditions.

Misuse

Any use or application deviating from the intended use is deemed to be impermissible misuse; examples of such misuse include:

- Transportation of persons and animals
- Use as a climbing aid
- Use outside the permissible operating parameters
- Use in potentially explosive environments
- Outdoor operation
- Use in medical or food technology
- Leaning on the robot arm
- Underground operation
- Operation without additional extraction for removal of the particles

NOTICE

Changing the structure of the robot, e.g. by drilling holes, can result in damage to the components. This is considered improper use and leads to loss of guarantee and liability entitlements.
3  Product description

3.1  Overview of the robot system

A robot system comprises all the assemblies of an industrial robot, including the
manipulator (robot arm and electrical installations), controller, connecting
cables, end effector (tool) and other equipment.

The industrial robot consists of the following components:

- Manipulator
- KUKA Sunrise Cabinet robot controller
- KUKA smartPAD control panel
- Connecting cables
- Software
- Options, accessories

Fig. 3-1: Overview of robot system

1  KUKA Sunrise Cabinet robot controller
2  KUKA smartPAD control panel
3  Connecting cable to the smartPAD
4  Manipulator
5  Control box
6  Control box connecting cables
7  Connecting cable to KUKA Sunrise Cabinet robot controller

3.2  Description of the LBR iiwa CR

Overview

The LBR iiwa CR is classified as a lightweight robot and is a jointed-arm robot
with 7 axes. All drive units and current-carrying cables are located inside the robot.

Every axis contains multiple sensors that provide signals for robot control (e.g.
position control and impedance control) and that are also used as a protective
function for the robot. Every axis is monitored by sensors: axis range sensors
ensure that the permissible axis range is adhered to, tor-
que sensors ensure that the permissible axis loads are not exceeded, and temperature sensors monitor the thermal limit values of the electronics. In the case of an unfavorable combination of permanently high demand on robot power and external temperature influences, the LBR is protected by this temperature monitoring which switches it off if the thermal limit values are exceeded. Following a cooling time, the LBR can be restarted with no need for additional measures. Technical Support is available to answer any questions.

The kinematic system is of redundant design due to its 7 axes and consists of the following main assemblies:

**Fig. 3-2: Main assemblies and robot axes**

1. In-line wrist
2. Joint module
3. Base frame
4. LBR CR base ring

**In-line wrist**

The robot is fitted with a 2-axis in-line wrist. The motors are located in axes A6 and A7.

**Joint module**

The joint modules consist of an aluminum structure. The drive units are situated inside these modules. In this way, the drive units are linked to one another via the aluminum structures.
Base frame

The base frame is the base of the robot. Interface A1 is located at the rear of the base frame. It constitutes the interface for the connecting cables between the robot, the controller and the energy supply system.

LBR CR base ring

The base ring is located under the shield plate (perforated floor plate) of the robot under axis 1. The fan, which is integrated into the base ring, is used for extraction of particles inside the housing. The extracted particles can be removed from the cleanroom environment using a cleanroom extraction system.

LBR CR control box

The control box controls operation of the fan in the LBR CR base ring and reads the tacho signal.

Electrical installations

The electrical installations include all the supply and control cables for the motors of axes A1 to A7. All the connections on the motors are plug-and-socket connections. The entire cabling is routed internally in the robot.
4 Technical data

4.1 Technical data, overview

Working envelope

The following diagrams (>>> Fig. 4-1) and (>>> Fig. 4-2) show the shape and size of the working envelope.

Fig. 4-1: LBR iiwa 7 R800 CR, working envelope, side view
The LBR CR base ring kit raises the position of the robot by 35 mm in the positive Z direction. This increase in height is not taken into consideration when using the “robot base coordinate system” and the “world coordinate system”. The deviation of 35 mm in the positive Z direction must be taken into consideration when displaying the Cartesian actual position and using the “world” base.

Further information about the coordinate systems and displaying the Cartesian actual position is contained in the operating and programming instructions for KUKA Sunrise.OS and KUKA Sunrise.Workbench.

### 4.2.3 Payloads, LBR iiwa 7 R800 CR

</tr>
<tr>
<td>Maximum supplementary load, arm</td>
<td>-</td>
</tr>
<tr>
<td>Nominal distance to load center of gravity</td>
<td>-</td>
</tr>
</tbody>
</table>
Load center of gravity

For all payloads, the load center of gravity refers to the distance from the face of the mounting flange on axis A7.

Fig. 4-3: Load center of gravity

Permissible mass inertia at the design point \((L_x, L_y, L_z)\) is 0.3 kgm².

Payload diagram

Fig. 4-4: LBR iiwa 7 R800 CR, payload diagram
The payloads depend on the media flange used. On the LBR iiwa 7 R800 CR, only the media flange Inside electrical may be used. The specified payloads apply only to this configuration.

**NOTICE**

This loading curve corresponds to the maximum load capacity. Both values (payload and mass moment of inertia) must be checked in all cases. Exceeding this capacity will reduce the service life of the robot and overload the motors and the gears; in any such case KUKA Customer Support must be consulted beforehand.

The values determined here are necessary for planning the robot application. For commissioning the robot, additional input data are required in accordance with the operating and programming instructions of the control software.

**Supplementary load**

The robot cannot carry a supplementary load.

### 4.2.4 Foundation data, LBR iiwa 7 R800 CR

**Foundation loads**

The specified forces and moments already include the payload and the inertia force (weight) of the robot.

**Fig. 4-5: Foundation loads, floor mounting**

Working envelope

The following diagrams (Fig. 4-6) and (Fig. 4-7) show the shape and size of the working envelope.

**Fig. 4-6: LBR iiwa 14 R820 CR, working envelope, side view**

**Fig. 4-7: LBR iiwa 14 R820 CR, working envelope, top view**
The LBR CR base ring kit raises the position of the robot by 35 mm in the positive Z direction. This increase in height is not taken into consideration when using the “robot base coordinate system” and the “world coordinate system”. The deviation of 35 mm in the positive Z direction must be taken into consideration when displaying the Cartesian actual position and using the “world” base.
Further information about the coordinate systems and displaying the Cartesian actual position is contained in the operating and programming instructions for KUKA Sunrise.OS and KUKA Sunrise.Workbench.

4.3.3 Payloads, LBR iiwa 14 R820 CR

</tbody>
</table>

Load center of gravity
For all payloads, the load center of gravity refers to the distance from the face of the mounting flange on axis A7.
Fig. 4-8: Load center of gravity

Permissible mass inertia at the design point \((L_x, L_y, L_z)\) is 0.3 kgm\(^2\).

Payload diagram

Fig. 4-9: LBR iiwa 14 R820 CR, payload diagram
The payloads depend on the media flange used. On the LBR iiwa 7 R800 CR, only the media flange Inside electrical may be used. The specified payloads apply only to this configuration.

**NOTICE**

This loading curve corresponds to the maximum load capacity. Both values (payload and mass moment of inertia) must be checked in all cases. Exceeding this capacity will reduce the service life of the robot and overload the motors and the gears; in any such case KUKA Customer Support must be consulted beforehand.

The values determined here are necessary for planning the robot application. For commissioning the robot, additional input data are required in accordance with the operating and programming instructions of the control software.

### 4.3.4 Foundation data, LBR iiwa 14 R820 CR

**Foundation loads**

The specified forces and moments already include the payload and the inertia force (weight) of the robot.

**NOTICE**

The foundation loads specified in the table are the maximum loads that may occur. They must be referred to when dimensioning the foundations and must be adhered to for safety reasons. Failure to do so may result in material damage.

### 4.4 Plates and labels

**Identification plate**

The following plates and labels are attached to the robot. They must not be removed or rendered illegible. Illegible plates and labels must be replaced.

| 3    | **Work on the robot**  
Before start-up, transportation or maintenance, read and follow the assembly and operating instructions. |
### 4.5 REACH duty to communicate information acc. to Art. 33 of Regulation (EC) 1907/2006

On the basis of the information provided by our suppliers, this product and its components contain no substances included on the “Candidate List” of Substances of Very High Concern (SVHCs) in a concentration exceeding 0.1 percent by mass.

### 4.6 Stopping distances and times

#### 4.6.1 General information

Information concerning the position control data:

- The stopping distance is the axis angle traveled by the robot from the moment the stop signal is triggered until the robot comes to a complete standstill.
- The stopping time is the time that elapses from the moment the stop signal is triggered until the robot comes to a complete standstill.
- The data are given for axes A1, A2, A3 and A4. These axes are the axes with the greatest deflection.
• The data apply to single-axis motions. Superposed axis motions can result in longer stopping distances.
• As reference, PTP motions with position control have been used without further parameterization (e.g. robot.move(ptp(Zielpose)) ).
• Stopping distances and stopping times in accordance with DIN EN ISO 10218-1, Annex B.
• Stop categories:
  – Stop category 0 » STOP 0
  – Stop category 1 » STOP 1 (path-maintaining) according to IEC 60204-1
• The values specified are guide values determined by means of tests and simulation. They are average values which conform to the requirements of DIN EN ISO 10218-1. The actual stopping distances and stopping times may differ due to internal and external influences on the braking torque. It is therefore advisable to determine the exact stopping distances and stopping times under the real conditions of the actual robot application.
• Measuring technique
  The stopping distances were measured using the robot-internal measuring technique with rated payloads.
• The wear on the brakes varies depending on the operating mode, robot application and the number of STOP 0 stops triggered. It is therefore advisable to check the stopping distance at least once a year.

The stopping distances and stopping times can be determined, for example, by using safety monitoring to trigger axis-specific or Cartesian workspace monitoring of the safety stop that is to be checked and evaluating the corresponding measured data from the trace (by means of DataRecorder).

5 Safety

5.1 Legal framework

5.1.1 Liability

The device described in this document is either an industrial robot or a component thereof.

Components of the industrial robot:
- Manipulator
- Robot controller
- Hand-held control panel
- Connecting cables
- Software
- Options, accessories

The industrial robot is built using state-of-the-art technology and in accordance with the recognized safety rules. Nevertheless, misuse of the industrial robot may constitute a risk to life and limb or cause damage to the industrial robot and to other material property.

The industrial robot may only be used in perfect technical condition in accordance with its designated use and only by safety-conscious persons who are fully aware of the risks involved in its operation. Use of the industrial robot is subject to compliance with this document and with the declaration of incorporation supplied together with the industrial robot. Any functional disorders affecting safety must be rectified immediately.

Safety information

Information about safety may not be construed against KUKA Deutschland GmbH. Even if all safety instructions are followed, this is not a guarantee that the industrial robot will not cause personal injuries or material damage.

No modifications may be carried out to the industrial robot without the authorization of KUKA Deutschland GmbH. Unauthorized modifications will result in the loss of warranty and liability claims.

Additional components (tools, software, etc.), not supplied by KUKA Deutschland GmbH, may be integrated into the industrial robot. The user is liable for any damage these components may cause to the industrial robot or to other material property.

In addition to the Safety chapter, this document contains further safety instructions. These must also be observed.

5.1.2 Intended use of the industrial robot

The industrial robot is intended exclusively for the use designated in the "Purpose" chapter of the operating instructions or assembly instructions.

Any use or application deviating from the intended use is deemed to be misuse and is not allowed. It will result in the loss of warranty and liability claims.

Operation of the industrial robot in accordance with its intended use also requires compliance with the operating and assembly instructions for the individual components, with particular reference to the maintenance specifications.
The user is responsible for carrying out a risk assessment. This indicates the additional safety equipment that is required, the installation of which is also the responsibility of the user.

**Misuse**

Any use or application deviating from the intended use is deemed to be misuse and is not allowed. This includes e.g.:

- Use as a climbing aid
- Operation outside the specified operating parameters
- Operation without the required safety equipment

**5.1.3 EC declaration of conformity and declaration of incorporation**

The industrial robot constitutes partly completed machinery as defined by the EC Machinery Directive. The industrial robot may only be put into operation if the following preconditions are met:

- The industrial robot is integrated into a complete system.
  - or: The industrial robot, together with other machinery, constitutes a complete system.
  - or: All safety functions and safeguards required for operation in the complete machine as defined by the EC Machinery Directive have been added to the industrial robot.
- The complete system complies with the EC Machinery Directive. This has been confirmed by means of a conformity assessment procedure.

**EC declaration of conformity**

The system integrator must issue an EC declaration of conformity for the complete system in accordance with the Machinery Directive. The EC declaration of conformity forms the basis for the CE mark for the system. The industrial robot must always be operated in accordance with the applicable national laws, regulations and standards.

The robot controller has a CE mark in accordance with the EMC Directive and the Low Voltage Directive.

**Declaration of incorporation**

The partly completed machinery is supplied with a declaration of incorporation in accordance with Annex II B of the Machinery Directive 2006/42/EC. The assembly instructions and a list of essential requirements complied with in accordance with Annex I are integral parts of this declaration of incorporation.

The declaration of incorporation declares that the start-up of the partly completed machinery is not allowed until the partly completed machinery has been incorporated into machinery, or has been assembled with other parts to form machinery, and this machinery complies with the terms of the EC Machinery Directive, and the EC declaration of conformity is present in accordance with Annex II A.

**5.2 Safety functions**

Safety functions are distinguished according to the safety requirements that they fulfill:
• Safety-oriented functions for the protection of personnel
The safety-oriented functions of the industrial robot meet the following safety requirements:

- **Category 3** and **Performance Level d** in accordance with EN ISO 13849-1
- **SIL 2** according to EN 62061

The requirements are only met on the following condition, however:

- All safety-relevant mechanical and electromechanical components of the industrial robot are tested for correct functioning during start-up and at least once every 12 months, unless otherwise determined in accordance with a workplace risk assessment. These include:
  - Local EMERGENCY STOP device on the teach pendant
  - Enabling device on the teach pendant
  - Enabling device on the hand guiding device (if present)
  - External enabling devices (if present)
  - Keyswitch on the smartPAD (if used as teach pendant)
  - Safety-oriented outputs of the discrete safety interface

Details about safety parameters (e.g. PFH, SIL, Performance Level) are also available as a SISTEMA library. The library can be downloaded from the KUKA website.

• Non-safety-oriented functions for the protection of machines
The non-safety-oriented functions of the industrial robot do not meet specific safety requirements:

**DANGER**
In the absence of the required operational safety functions and safeguards, the industrial robot can cause personal injury or material damage. If the required safety functions or safeguards are dismantled or deactivated, the industrial robot may not be operated.

During system planning, the safety functions of the overall system must also be planned and designed. The industrial robot must be integrated into this safety system of the overall system.

### 5.2.1 Terms used

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Axis range</td>
<td>Range within which the axis may move. The axis range must be defined for each axis.</td>

</tbody>
</table>

### 5.2.2 Personnel

The following persons or groups of persons are defined for the industrial robot:

- User
- Personnel

![Warning](image)

All persons working with the industrial robot must have read and understood the industrial robot documentation, including the safety chapter.

#### User

The user must observe the labor laws and regulations. This includes e.g.:

- The user must comply with his monitoring obligations.
- The user must carry out briefing at defined intervals.

#### Personnel

Personnel must be instructed, before any work is commenced, in the type of work involved and what exactly it entails as well as any hazards which may exist. Instruction must be carried out regularly. Instruction is also required after particular incidents or technical modifications.

Personnel includes:

- System integrator
- Operators, subdivided into:
  - Start-up, maintenance and service personnel
  - Operating personnel
  - Cleaning personnel

![Warning](image)

Installation, exchange, adjustment, operation, maintenance and repair must be performed only as specified in the operating or assembly instructions for the relevant component of the industrial robot and only by personnel specially trained for this purpose.
System integrator

The industrial robot is safely integrated into a complete system by the system integrator.

The system integrator is responsible for the following tasks:

• Installing the industrial robot
• Connecting the industrial robot
• Performing risk assessment
• Implementing the required safety functions and safeguards
• Issuing the EC declaration of conformity
• Attaching the CE mark
• Creating the operating instructions for the system

Operators

The operator must meet the following preconditions:

• The operator must be trained for the work to be carried out.
• Work on the system must only be carried out by qualified personnel. These are people who, due to their specialist training, knowledge and experience, and their familiarization with the relevant standards, are able to assess the work to be carried out and detect any potential hazards.

\[\text{Work on the electrical and mechanical equipment of the manipulator may only be carried out by KUKA Deutschland GmbH.}\]

5.2.3 Workspace, safety zone and danger zone

Working zones are to be restricted to the necessary minimum size in order to prevent danger to persons or the risk of material damage. Safely monitored axis limits that limit the motion range of an axis and are required for personnel protection are configurable.

\[\text{Further information about configuring safely monitored axis limits is contained in the “Safety configuration” chapter of the operating and programming instructions of the system software for system integrators.}\]

The danger zone consists of the workspace and the stopping distances of the manipulator. In the event of a stop, the manipulator is braked and comes to a stop within the danger zone. The safety zone is the area outside the danger zone.

The danger zone must be protected by means of physical safeguards, e.g. by light barriers, light curtains or safety fences. If there are no physical safeguards present, the requirements for collaborative operation in accordance with EN ISO 10218 must be met. There must be no shearing or crushing hazards at the loading and transfer areas.
5.2.4 Safety-oriented functions

The following safety-oriented functions are present and permanently defined in the industrial robot:

- EMERGENCY STOP device
- Enabling device

The following safety-oriented functions are preconfigured and can be integrated into the system via the safety interface of the robot controller:

- Operator safety (= connection for the monitoring of physical guards)
- External EMERGENCY STOP device
- External safety stop 1 (path-maintaining)

Other safety-oriented functions can also be configured, e.g.:

- External enabling device
- External safe operational stop
- Axis-specific workspace monitoring
- Cartesian workspace monitoring
- Cartesian protected space monitoring
- Velocity monitoring
- Standstill monitoring
- Axis torque monitoring
- Collision detection

Further information about configuring the safety functions is contained in the “Safety configuration” chapter of the operating and programming instructions of the system software for system integrators.
The preconfigured safety functions are described in the following sections on safety.

### 5.2.4.1 EMERGENCY STOP device

As standard, the EMERGENCY STOP device of the industrial robot is the EMERGENCY STOP device on the smartPAD teach pendant. The EMERGENCY STOP device must be pressed in the event of a hazardous situation or emergency.

Reaction of the industrial robot if the EMERGENCY STOP device is pressed:

- The manipulator stops with a safety stop 1 (path-maintaining).

Before operation can be resumed, the EMERGENCY STOP device must be turned to release it.

> From KUKA Sunrise.OS 2.4 onwards, the inputs for the local EMERGENCY STOP can be configured, i.e. a different EMERGENCY STOP device can be connected and used for the local EMERGENCY STOP.

**WARNING**

Tools and other equipment connected to the robot must be integrated into the EMERGENCY STOP circuit on the system side if they could constitute a potential hazard. Failure to observe this precaution may result in death, severe injuries or considerable damage to property.

If a holder is used for the teach pendant and conceals the EMERGENCY STOP device on the teach pendant, an external EMERGENCY STOP device must be installed that is accessible at all times.

>>> 5.2.4.4 "External EMERGENCY STOP device" Page 59

### 5.2.4.2 Enabling device

As standard, the enabling device of the industrial robot is the enabling device on the smartPAD teach pendant.

There are 3 enabling switches installed on the smartPAD. The enabling switches have 3 positions:

- Not pressed
- Center position
- Fully pressed (panic position)

In the test modes and in CRR, the manipulator can only be moved if one of the enabling switches is held in the central position.

- Releasing the enabling switch triggers a safety stop 1 (path-maintaining).
- Fully pressing the enabling switch triggers a safety stop 1 (path-maintaining).

> From KUKA Sunrise.OS 2.4 onwards, the inputs of the enabling device for the teach pendant can be configured, i.e. a different teach pendant with enabling device can be connected and used.

If an enabling switch malfunctions (e.g. jams in the center position), the industrial robot can be stopped using one of the following methods:

- Press another enabling switch down fully.
- Actuate the EMERGENCY STOP device.
- Release the Start key.

**WARNING**
The enabling switches must not be held down by adhesive tape or other means or tampered with in any other way. Death, injuries or damage to property may result.

5.2.4.3 **“Operator safety” signal**

The "operator safety" signal is used for monitoring physical safeguards, e.g. safety gates. In the default configuration, T2 and automatic operation are not possible without this signal. Alternatively, the requirements for collaborative operation in accordance with EN ISO 10218 must be met.

Reaction of the industrial robot in the event of a loss of signal during T2 or automatic operation (default configuration):

- The manipulator stops with a safety stop 1 (path-maintaining).

By default, operator safety is not active in the modes T1 (Manual Reduced Velocity) and CRR, i.e. the signal is not evaluated.

**WARNING**

Following a loss of signal, automatic operation must not be resumed merely by closing the safeguard; the signal for operator safety must first be set by an additional device, e.g. by an acknowledge button. It is the responsibility of the system integrator to ensure this. This is to prevent automatic operation from being resumed inadvertently while there are still persons in the danger zone, e.g. due to the safety gate closing accidentally.

- This additional device must be designed in such a way that an actual check of the danger zone can be carried out first. Devices that do not allow this (e.g. because they are automatically triggered by closure of the safeguard) are not permitted.
- Failure to observe this may result in death to persons, severe injuries or considerable damage to property.

5.2.4.4 **External EMERGENCY STOP device**

Every operator station that can initiate a robot motion or other potentially hazardous situation must be equipped with an EMERGENCY STOP device. The system integrator is responsible for ensuring this.

Reaction of the industrial robot if the external EMERGENCY STOP device is pressed (default configuration):

- The manipulator stops with a safety stop 1 (path-maintaining).

External EMERGENCY STOP devices are connected via the safety interface of the robot controller. External EMERGENCY STOP devices are not included in the scope of supply of the industrial robot.

5.2.4.5 **External safety stop 1 (path-maintaining)**

The external safety stop 1 (path-maintaining) can be triggered via an input on the safety interface (default configuration). The state is maintained as long as the external signal is FALSE. If the external signal is TRUE, the manipulator can be moved again. No acknowledgement is required.
5.2.4.6 External enabling device

External enabling devices are required if it is necessary for more than one person to be in the danger zone of the industrial robot.

Multiple external enabling devices can be connected via the safety interface of the robot controller. External enabling devices are not included in the scope of supply of the industrial robot.

An external enabling device can be used for manual guidance of the robot. When enabling is active, the robot may only be moved at reduced velocity.

For manual guidance, safety-oriented velocity monitoring with a maximum permissible velocity of 250 mm/s is preconfigured. The maximum permissible velocity can be adapted.

The value for the maximum permissible velocity must be determined as part of a risk assessment.

5.2.4.7 External safe operational stop

The safe operational stop is a standstill monitoring function. It does not stop the robot motion, but monitors whether the robot axes are stationary.

The safe operational stop can be triggered via an input on the safety interface. The state is maintained as long as the external signal is FALSE. If the external signal is TRUE, the manipulator can be moved again. No acknowledgement is required.

5.2.5 Triggers for safety-oriented stop reactions

Stop reactions are triggered in response to operator actions or as a reaction to monitoring functions and errors. The following tables show the different stop reactions according to the operating mode that has been set.

Overview

In KUKA Sunrise a distinction is made between the following triggers:

- Permanently defined triggers
  
  Permanently defined triggers for stop reactions and the associated stop category are preset by the system and cannot be changed. However, it is possible for the implemented stop reaction to be stepped up in the user-specific safety configuration.

- User-specific triggers

  In addition to the permanently defined triggers, the user can also configure other triggers for stop reactions including the associated stop category.

Further information about configuring the safety functions is contained in the “Safety configuration” chapter of the operating and programming instructions of the system software for system integrators.

Permanently defined triggers

The following triggers for stop reactions are permanently defined:
### User-specific triggers

When creating a new Sunrise project, the system automatically generates a project-specific safety configuration. This contains the following user-specific stop reaction triggers preconfigured by KUKA (in addition to the permanently defined triggers):

<table>
<thead>
<tr>
<th>Trigger</th>
<th>T1, CRR</th>
<th>T2, AUT</th>
</tr>
</thead>
<tbody>
<tr>
<td>Safety gate opened (operator safety)</td>
<td>-</td>
<td>Safety stop 1 (path-maintaining)</td>
</tr>
<tr>
<td>External E-STOP pressed</td>
<td>Safety stop 1 (path-maintaining)</td>
<td></td>
</tr>
<tr>
<td>External safety stop</td>
<td>Safety stop 1 (path-maintaining)</td>
<td></td>
</tr>
</tbody>
</table>

This default safety configuration is valid for the system software without additionally installed option packages or catalog elements. If additional option packages or catalog elements have been installed, the default safety configuration may be modified.

### Triggers for manual guidance

If an enabling device is configured for manual guidance, the following additional triggers for stop reactions are permanently defined:

<table>
<thead>
<tr>
<th>Trigger</th>
<th>T1, CRR</th>
<th>T2, AUT</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manual guidance enabling switch released</td>
<td>Safety stop 1 (path-maintaining)</td>
<td>-</td>
</tr>
<tr>
<td>Manual guidance enabling switch pressed fully down (panic position)</td>
<td>Safety stop 1 (path-maintaining)</td>
<td>-</td>
</tr>
<tr>
<td>Maximum permissible velocity exceeded while manual guidance enabling signal is set</td>
<td>Safety stop 1 (path-maintaining)</td>
<td></td>
</tr>
</tbody>
</table>

A maximum permissible velocity of 250 mm/s is preconfigured for manual guidance. The maximum permissible velocity can be adapted. The value for the maximum permissible velocity must be determined as part of a risk assessment.

### 5.2.6 Non-safety-oriented functions

#### 5.2.6.1 Mode selection

The industrial robot can be operated in the following modes:

- Manual Reduced Velocity (T1)
- Manual High Velocity (T2)
- Automatic (AUT)
- Controlled robot retraction (CRR)

<table>
<thead>
<tr>
<th>Operating mode</th>
<th>Use</th>
<th>Velocities</th>
</tr>
</thead>
</table>
| T1             | Programming, teaching and testing of programs. | • Program verification: Reduced programmed velocity, maximum 250 mm/s  
|                |     | • Jog mode: Jog velocity, maximum 250 mm/s  
|                |     | • Manual guidance: No limitation of the velocity, but safety-oriented velocity monitoring in accordance with the safety configuration  
|                |     | **Note:** The maximum velocity of 250 mm/s does not apply to a mobile platform. |
| T2             | Testing of programs | • Program verification: Programmed velocity  
|                |     | • Jog mode: Not possible |
| AUT            | Automatic execution of programs  
|                | For industrial robots with and without higher-level controllers | • Program operation: Programmed velocity  
|                |     | • Jog mode: Not possible |
| CRR            | CRR is an operating mode which can be selected when the industrial robot is stopped by the safety controller for one of the following reasons:  
|                |     | • Industrial robot violates an axis-specific or Cartesian monitoring space.  
|                |     | • Orientation of a safety-oriented tool is outside the monitored range.  
|                |     | • Industrial robot violates a force or axis torque monitoring function.  
|                |     | • A position sensor is not mastered or referenced.  
|                |     | • An axis torque sensor is not referenced.  
|                |     | After changing to CRR mode, the industrial robot may once again be moved. | • Program verification: Reduced programmed velocity, maximum 250 mm/s  
|                |     | • Jog mode: Jog velocity, maximum 250 mm/s  
|                |     | • Manual guidance: No limitation of the velocity, but safety-oriented velocity monitoring in accordance with the safety configuration |

### 5.2.6.2 Velocity monitoring in T1

The reduced velocity in T1 does not constitute a safety-rated reduced speed in the standard safety configuration, i.e. the maximum permissible velocity of 250 mm/s in T1 is not subjected to safety-oriented monitoring. If the application requires safety-oriented velocity monitoring in T1, this can be added in the safety configuration. The safety option KUKA Sun-
riseSafeOperation provides the monitoring function Cartesian velocity monitoring for this purpose.

Further information about configuring safety-oriented velocity monitoring for T1 is contained in the “Safety configuration” chapter of the operating and programming instructions of the system software for system integrators.

5.2.6.3 Software limit switches

The axis ranges of all manipulator axes are limited by means of non-safety-oriented software limit switches. These software limit switches only serve as machine protection and are preset in such a way that the manipulator is stopped under servo control if the axis limit is exceeded, thereby preventing damage to the mechanical equipment.

5.3 Additional protective equipment

5.3.1 Jog mode

In the operating modes T1 (Manual Reduced Velocity), T2 (Manual High Velocity) and CRR, the robot controller can only execute programs in jog mode. This means that it is necessary to hold down an enabling switch and the Start key in order to execute a program.

- Releasing the enabling switch on the smartPAD triggers a safety stop 1 (path-maintaining).
- Pressing fully down on the enabling switch on the smartPAD triggers a safety stop 1 (path-maintaining).
- Releasing the Start key triggers a stop of Stop category 1 (path-maintaining).

5.3.2 Labeling on the industrial robot

All plates, labels, symbols and marks constitute safety-relevant parts of the industrial robot. They must not be modified or removed.

Labeling on the industrial robot consists of:

- Identification plates
- Warning signs
- Safety symbols
- Designation labels
- Cable markings
- Rating plates

Further information is contained in the technical data of the operating instructions or assembly instructions of the components of the industrial robot.

5.3.3 External safeguards

The access of persons to the danger zone of the industrial robot must be prevented by means of safeguards. Alternatively, the requirements for collaborative operation in accordance with EN ISO 10218 must be met. It is the responsibility of the system integrator to ensure this.
Physical safeguards must meet the following requirements:

- They meet the requirements of EN ISO 14120.
- They prevent access of persons to the danger zone and cannot be easily circumvented.
- They are sufficiently fastened and can withstand all forces that are likely to occur in the course of operation, whether from inside or outside the enclosure.
- They do not, themselves, represent a hazard or potential hazard.
- The prescribed minimum clearance from the danger zone is maintained.

Safety gates (maintenance gates) must meet the following requirements:

- They are reduced to an absolute minimum.
- The interlocks (e.g. safety gate switches) are linked to the configured operator safety inputs of the robot controller.
- Switching devices, switches and the type of switching conform to the requirements of Performance Level d and category 3 according to EN ISO 13849-1.
- Depending on the risk situation: the safety gate is additionally safeguarded by means of a locking mechanism that only allows the gate to be opened if the manipulator is safely at a standstill.
- The device for setting the signal for operator safety, e.g. the button for acknowledging the safety gate, is located outside the space limited by the safeguards.

Further information is contained in the corresponding standards and regulations. These also include EN ISO 14120.

Other safety equipment

Other safety equipment must be integrated into the system in accordance with the corresponding standards and regulations.

5.4 Safety measures

5.4.1 General safety measures

The industrial robot may only be used in perfect technical condition in accordance with its intended use and only by safety-conscious persons. Operator errors can result in personal injury and damage to property.

It is important to be prepared for possible movements of the industrial robot even after the robot controller has been switched off and locked out. Incorrect installation (e.g. overload) or mechanical defects (e.g. brake defect) can cause the manipulator to sag. If work is to be carried out on a switched-off industrial robot, the manipulator must first be moved into a position in which it is unable to move on its own, whether the payload is mounted or not. If this is not possible, the manipulator must be secured by appropriate means.

DANGER

In the absence of operational safety functions and safeguards, the industrial robot can cause personal injury or material damage. If safety functions or safeguards are dismantled or deactivated, the industrial robot may not be operated.
WARNING

Standing underneath the robot arm can cause death or serious injuries. Especially if the industrial robot is moving objects that can become detached (e.g. from a gripper). For this reason, standing underneath the robot arm is prohibited!

HRC

In the case of collaborative operation (HRC), the system must be equipped with a visual display indicating when the robot is in collaborative operation.

smartPAD

The user must ensure that the industrial robot is only operated with the smartPAD by authorized persons.

If more than one smartPAD is used in the overall system, it must be ensured that each smartPAD is unambiguously assigned to the corresponding industrial robot. It must be ensured that 2 smartPADs are not interchanged.

The smartPAD can be configured as un pluggable.

WARNING

If the smartPAD is disconnected, the system can no longer be switched off by means of the EMERGENCY STOP device on the smartPAD. If the smartPAD is configured as un pluggable, at least one external EMERGENCY STOP device must be installed that is accessible at all times.

Failure to observe this can lead to death, injury or property damage.

WARNING

The operator must ensure that disconnected smartPADs are immediately removed from the system and stored out of sight and reach of personnel working on the industrial robot. This prevents operational and non-operational EMERGENCY STOP devices from becoming interchanged.

Failure to observe this can lead to death, injury or property damage.

Modifications

After modifications to the industrial robot, checks must be carried out to ensure the required safety level. The valid national or regional work safety regulations must be observed for this check. The correct functioning of all safety functions must also be tested.

New or modified programs must always be tested first in Manual Reduced Velocity mode (T1).

After modifications to the industrial robot, existing programs must always be tested first in Manual Reduced Velocity mode (T1). This applies to all components of the industrial robot and includes modifications to the software and configuration settings.

The robot may not be connected and disconnected when the robot controller is running.

Faults

The following tasks must be carried out in the case of faults in the industrial robot:
• Switch off the robot controller and secure it (e.g. with a padlock) to prevent unauthorized persons from switching it on again.
• Indicate the fault by means of a label with a corresponding warning (tagout).
• Keep a record of the faults.
• Eliminate the fault and carry out a function test.

5.4.2 IT security

The industrial robot may only be used in perfect technical condition in accordance with its intended use and only by safety-conscious persons.

In particular, security-conscious use includes that it be operated in an IT environment which meets the current security-relevant standards and for which there is an overall concept for IT security.

IT security entails not only technical aspects but, at a minimum, also those of organization, personnel and infrastructure.
KUKA urgently recommends that operators implement an information security management system for their products which designs, coordinates and monitors the tasks related to information security.

Sources for information about IT security for companies include:
• Independent consulting firms
• National cyber security authorities

National authorities often make their recommendations available on the Internet. In addition to their official language, some national authorities provide their information in English.

5.4.3 Transportation

Manipulator

The prescribed transport position of the manipulator must be observed. Transportation must be carried out in accordance with the operating instructions or assembly instructions of the robot.
Avoid vibrations and impacts during transportation in order to prevent damage to the manipulator.

Robot controller

The prescribed transport position of the robot controller must be observed. Transportation must be carried out in accordance with the operating instructions or assembly instructions of the robot controller.
Avoid vibrations and impacts during transportation in order to prevent damage to the robot controller.

5.4.4 Start-up and recommissioning

Before starting up systems and devices for the first time, a check must be carried out to ensure that the systems and devices are complete and operational, that they can be operated safely and that any damage is detected.

The valid national or regional work safety regulations must be observed for this check. The correct functioning of all safety functions must also be tested.
Prior to start-up, the passwords for the user groups must be modified by the administrator, transferred to the robot controller in an installation procedure and activated. The passwords must only be communicated to authorized personnel.

**DANGER**

The robot controller is preconfigured for the specific industrial robot. If cables are interchanged, the manipulator may receive incorrect data and can thus cause personal injury or material damage. If a system consists of more than one manipulator, always connect the connecting cables to the manipulators and their corresponding robot controllers.

If additional components (e.g. cables), which are not part of the scope of supply of KUKA Deutschland GmbH, are integrated into the industrial robot, the user is responsible for ensuring that these components do not adversely affect or disable safety functions.

**NOTICE**

If the internal cabinet temperature of the robot controller differs greatly from the ambient temperature, condensation can form, which may cause damage to the electrical components. Do not put the robot controller into operation until the internal temperature of the cabinet has adjusted to the ambient temperature.

**Function test**

The following tests must be carried out before start-up and recommissioning:

**General test:**

It must be ensured that:

- The industrial robot is correctly installed and fastened in accordance with the specifications in the documentation.
- There are no foreign bodies or defective or loose parts on the industrial robot.
- All required safety equipment is correctly installed and operational.
- The power supply ratings of the industrial robot correspond to the local supply voltage and mains type.
- The ground conductor and the equipotential bonding cable are sufficiently rated and correctly connected.
- The connecting cables are correctly connected and the connectors are locked.

**Test of the safety functions:**

A function test must be carried out for all the safety-oriented functions to ensure that they are working correctly:

**Test of the safety-relevant mechanical and electromechanical components:**

The following tests must be performed prior to start-up and at least once every 12 months unless otherwise determined in accordance with a workplace risk assessment:

- Function of all connected EMERGENCY STOP devices

  Press the EMERGENCY STOP device. A message must be displayed on the teach pendant indicating that the EMERGENCY STOP has been actuated. At the same time, no error message may be displayed about the EMERGENCY STOP device.
• Function of the enabling switches of all connected enabling devices
  Move the robot in Test mode and release the enabling switch. The robot motion must be stopped. At the same time, no error message may be displayed on the teach pendant about the enabling device.
  The test must always be carried out for all enabling switches of a connected enabling device.
  If the state of the enabling device is configured at an output, the test can also be performed via the output.

• Panic function of the enabling switches of all connected enabling devices
  Move the robot in Test mode and press the enabling switch down fully. The robot motion must be stopped. At the same time, no error message may be displayed on the teach pendant about the enabling device.
  The test must always be carried out for all enabling switches of a connected enabling device.
  If the state of the enabling device is configured at an output, the test can also be performed via the output.

• Function of the keyswitch on the smartPAD (if used as teach pendant)
  Turn the keyswitch to the right and then back again. There must be no error message displayed on the smartPAD.

• Switch-off capability of the safety-oriented outputs
  Switch robot controller off and then on again. After it is switched on, no error message relating to a safety-oriented output may be displayed on the teach pendant.

In the case of incomplete start-up of the system, additional substitute measures for minimizing risk must be taken and documented, e.g. installation of a safety fence, attachment of a warning sign, locking of the main switch. Start-up is incomplete, for example, if not all safety functions have yet been implemented, or if a function test of the safety functions has not yet been carried out.

Test of the functional capability of the brakes:
For the industrial robot, a brake test is available which can be used to check whether the brake of each axis applies sufficient braking torque.

The brake test ensures that any impairment of the braking function is detected, e.g. due to wear, overheating, fouling or damage, thereby eliminating avoidable risks.

The brake test must be performed regularly, unless an application-specific risk assessment has established that a malfunction of the mechanical brakes will not result in inadmissibly high risks. Determination of the interval at which the brake test is to be performed also constitutes part of the risk assessment.

In the absence of a corresponding risk assessment, the following applies:

• The brake test must be carried out for each axis during start-up and recommissioning of the industrial robot.
• The brake test must be performed daily during operation.
5.4.5 Manual mode

General

Manual mode is the mode for setup work. Setup work is all the tasks that have to be carried out on the industrial robot to enable automatic operation. Setup work includes:

• Jog mode
• Teaching
• Program verification

The following must be taken into consideration in manual mode:

• New or modified programs must always be tested first in Manual Reduced Velocity mode (T1).
• The manipulator and its tooling must never touch or project beyond the safety fence.
• Workpieces, tooling and other objects must not become jammed as a result of the industrial robot motion, nor must they lead to short-circuits or be liable to fall off.
• All setup work must be carried out, where possible, from outside the safeguarded area.

Setup work in T1

If it is necessary to carry out setup work from inside the safeguarded area, the following must be taken into consideration in the operating mode Manual Reduced Velocity (T1):

• If it can be avoided, there must be no other persons inside the safeguarded area.
  If it is necessary for there to be several persons inside the safeguarded area, the following must be observed:
    – Each person must have an enabling device.
    – All persons must have an unimpeded view of the industrial robot.
    – Eye-contact between all persons must be possible at all times.
• The operator must be so positioned that he can see into the danger area and get out of harm's way.
• Unexpected motions of the manipulator cannot be ruled out, e.g. in the event of a fault. For this reason, an appropriate clearance must be maintained between persons and the manipulator (including tool).
  Guide value: 50 cm.
  The minimum clearance may vary depending on local circumstances, the motion program and other factors. The minimum clearance that is to apply for the specific application must be decided by the user on the basis of a risk assessment.

Setup work in T2

If it is necessary to carry out setup work from inside the safeguarded area, the following must be taken into consideration in the operating mode Manual High Velocity (T2):

• This mode may only be used if the application requires a test at a velocity higher than that possible in T1 mode.
• Teaching is not permissible in this operating mode.
• Before commencing the test, the operator must ensure that the enabling devices are operational.
• The operator must be positioned outside the danger zone.
• There must be no-one present inside the safeguarded area. It is the responsibility of the operator to ensure this.

5.4.6 Automatic mode

Automatic mode is only permissible in compliance with the following safety measures:

• All safety equipment and safeguards are present and operational.
• There are no persons in the system, or the requirements for collaborative operation in accordance with EN ISO 10218 have been met.
• The defined working procedures are adhered to.

If the manipulator comes to a standstill for no apparent reason, the danger zone must not be entered until an EMERGENCY STOP has been triggered.

5.4.7 Maintenance and repair

After maintenance and repair work, checks must be carried out to ensure the required safety level. The valid national or regional work safety regulations must be observed for this check. The correct functioning of all safety functions must also be tested.

The purpose of maintenance and repair work is to ensure that the system is kept operational or, in the event of a fault, to return the system to an operational state. Repair work includes troubleshooting in addition to the actual repair itself.

The following safety measures must be carried out when working on the industrial robot:

• Carry out work outside the danger zone. If work inside the danger zone is necessary, the user must define additional safety measures to ensure the safe protection of personnel.
• Switch off the industrial robot and secure it (e.g. with a padlock) to prevent it from being switched on again. If it is necessary to carry out work with the robot controller switched on, the user must define additional safety measures to ensure the safe protection of personnel.
• If it is necessary to carry out work with the robot controller switched on, this may only be done in operating mode T1.
• Label the system with a sign indicating that work is in progress. This sign must remain in place, even during temporary interruptions to the work.
• The EMERGENCY STOP devices must remain active. If safety functions or safeguards are deactivated during maintenance or repair work, they must be reactivated immediately after the work is completed.

DANGER

Before work is commenced on live parts of the robot system, the main switch must be turned off and secured against being switched on again. The system must then be checked to ensure that it is deenergized. It is not sufficient, before commencing work on live parts, to execute an EMERGENCY STOP or a safety stop, or to switch off the drives, as this does not disconnect the robot system from the mains power supply. Parts remain energized. Death or severe injuries may result.

Faulty components must be replaced using new components with the same article numbers or equivalent components approved by KUKA Deutschland GmbH for this purpose.
Cleaning and preventive maintenance work is to be carried out in accordance with the operating instructions.

**Robot controller**

Even when the robot controller is switched off, parts connected to peripheral devices may still carry voltage. The external power sources must therefore be switched off if work is to be carried out on the robot controller.

The ESD regulations must be adhered to when working on components in the robot controller.

Voltages in excess of 60 V can be present in various components for several minutes after the robot controller has been switched off! To prevent life-threatening injuries, no work may be carried out on the industrial robot in this time.

Water and dust must be prevented from entering the robot controller.

### 5.4.8 Decommissioning, storage and disposal

The industrial robot must be decommissioned, stored and disposed of in accordance with the applicable national laws, regulations and standards.

### 5.4.9 Safety measures for “single point of control”

**Overview**

If certain components in the industrial robot are operated, safety measures must be taken to ensure complete implementation of the principle of “single point of control” (SPOC).

Components:

- Tools for configuration of bus systems with online functionality

The implementation of additional safety measures may be required. This must be clarified for each specific application; this is the responsibility of the user of the system.

Since only the system integrator knows the safe states of actuators in the periphery of the robot controller, it is his task to set these actuators to a safe state.

**T1, T2, CRR**

In modes T1, T2 and CRR, a robot motion can only be initiated if an enabling switch is held down.

**Tools for configuration of bus systems**

If these components have an online functionality, they can be used with write access to modify programs, outputs or other parameters of the robot controller, without this being noticed by any persons located inside the system.

Such tools include:

- KUKA Sunrise.Workbench
- WorkVisual from KUKA
- Tools from other manufacturers
Safety measure:

- In the test modes, programs, outputs or other parameters of the robot controller must not be modified using these components.

### 5.5 Applied standards and directives

6 Planning

6.1 Information for planning

In the planning and design phase, care must be taken regarding the functions or applications to be executed by the kinematic system. The following conditions can lead to premature wear. They necessitate shorter maintenance intervals and/or earlier exchange of components. In addition, the permissible operating parameters specified in the technical data must be taken into account and observed during planning.

- Continuous operation near temperature limits or in abrasive environments
- Continuous operation close to the performance limits, e.g., high rpm of an axis
- High duty cycle of individual axes
- Monotonous motion profiles, e.g., short, frequently recurring axis motions
- Static axis positions, e.g., continuous vertical position of a wrist axis
- External forces (process forces) acting on the robot

If one or more of these conditions are to apply during operation of the kinematic system, KUKA Deutschland GmbH must be consulted.

If the robot reaches its corresponding operation limit or if it is operated near the limit for a period of time, the built-in monitoring functions come into effect and the robot is automatically switched off. This protective function can limit the availability of the robot system.

The LBR CR base ring kit raises the position of the robot by 35 mm in the positive Z direction. This increase in height is not taken into consideration when using the “robot base coordinate system” and the “world coordinate system”. The deviation of 35 mm in the positive Z direction must be taken into consideration when displaying the Cartesian actual position and using the “world” base. Further information about the coordinate systems and displaying the Cartesian actual position is contained in the operating and programming instructions for KUKA Sunrise.OS and KUKA Sunrise.Workbench.

6.2 Mounting variant

The following mounting variant is available for installing the robot:

- Machine frame mounting with centering

6.2.1 Machine frame mounting with centering

The machine frame mounting assembly is used when the robot is fastened on a steel structure, a booster frame (pedestal) or a KUKA linear unit. It must be ensured that the substructure is able to withstand safely the forces occurring during operation (foundation loads). The following diagram contains all the necessary information that must be observed when preparing the mounting surface. KUKA Deutschland GmbH merely provides the locating pins.

The machine frame mounting assembly consists of:

- Locating pins
- Allen screws
Dimensioned drawing

The following illustrations provide all the necessary information on machine frame mounting, together with the required foundation data.

- **LBR iiwa 7 R800 CR**

![Dimensioned drawing of machine frame mounting, LBR iiwa 7 R800 CR](image)

1. Flat-sided locating pin, 6x12
2. Cylindrical locating pin, 6x12
3. M8x65-8.8 Allen screw (4x) with washer
4. Steel structure

For the exhaust air duct, a centrally positioned aperture with a diameter of 120 mm must be provided.

- **LBR iiwa 14 R820 CR**
Fig. 6-2: Dimensioned drawing of machine frame mounting, LBR iiwa 14 R820 CR

1  Flat-sided locating pin, 6x12
2  Cylindrical locating pin, 6x12
3  M10x70-8.8 Allen screw (4x) with washer
4  Steel structure

For the exhaust air duct, a centrally positioned aperture with a diameter of 120 mm must be provided.

6.3 Exhaust air duct interface

The LBR CR kit is used for extraction of particles inside the housing. The extracted particles must be removed from the cleanroom via an exhaust air duct. The exhaust air duct is not included in the scope of supply and must be installed by the customer.

The dimensions for the exhaust air duct on the LBR iiwa CR can be noted from the following diagram (Fig. 6-3).
Fig. 6-3: Exhaust air duct interface, LBR iiwa 7 R800 CR

Fig. 6-4: Exhaust air duct interface, LBR iiwa 14 R820 CR
6.4 Installing the control box

The control box is installed near the robot controller. The control box has four holes for attaching it. The dimensions of the predrilled holes on the control box can be noted from the following figure.

![Fig. 6-5: Dimensions of control box](image)

NOTICE

The control box must be installed outside the workspace of the robot.

6.5 Connecting cables and interfaces

Connecting cables

The connecting cables comprise all the cables for transferring energy and signals between the robot and the robot controller. They are connected on the robot side at interface A1. The set of connecting cables comprises:

- Data cable with power supply, 7 m

Also included are the cables for transferring energy and signals between the robot and the control box, and between the control box and the controller:

- Data cable with power supply from robot to control box, 7 m
- Data cable with power supply from control box to controller, 1.5 m

The following points must be observed when planning and routing the connecting cables:

- The bending radius for fixed routing must not be less than 45 mm for data cables.
- Protect cables against exposure to mechanical stress.
- Route the cables without mechanical stress – no tensile forces on the connectors
- Cables are only to be installed indoors.
- Observe permissible temperature range (fixed installation) of 263 K (-10 °C) to 343 K (+70 °C).
• Route the connecting cable in a metal duct; if necessary, additional measures must be taken to ensure electromagnetic compatibility (EMC).

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
<tbody>
<tr>
<td>The cables must be routed in such a way as to prevent the risk of tripping. The user must consider the hazard in a risk analysis.</td>
</tr>
</tbody>
</table>
7 Transportation

7.1 Transportation

It must be ensured that the robot is stable while it is being transported. The robot must remain in its transport position until it has been fastened in position. Before the robot is transported, the tooling must be dismounted and the connecting cables must be unplugged.

The following transportation variants are available for transporting the robot:

- Transport packaging

(>>> 7.1.1 "Transportation with transport packaging" Page 79)

**WARNING**

Use of unsuitable handling equipment may result in damage to the robot or injury to persons. Only use authorized handling equipment with a sufficient load-bearing capacity. Only transport the robot in the manner specified here.

**NOTICE**

The robot may only be transported in the transport position and in the transport container provided.

For removal, the robot must be lifted between axes A2 and A3 and between A4 and A5. This applies to both transportation variants.

### 7.1.1 Transportation with transport packaging

**Transport position**

The robot must be in the transport position before it can be transported. The robot is in the transport position when the axes are in the following positions:

<table>
<thead>
<tr>
<th></th>
<th>A1</th>
<th>A2</th>
<th>A3</th>
<th>A4</th>
<th>A5</th>
<th>A6</th>
<th>A7</th>

<td>90°</td>
<td>0°</td>
<td>0°</td>
<td>0°</td>
</tr>
</tbody>
</table>

![Fig. 7-1: Robot in transport position](image)
Transport dimensions

Transport the robot in the transport packaging provided that has the following outer dimensions:

- Length: 1180 mm
- Width: 780 mm
- Height: 595 mm

The transport dimensions are identical for both variants.
8 Appendix

8.1 Tightening torques

Tightening torques

The following tightening torques (Nm) are valid for screws and nuts where no other specifications are given. The specified values apply to lightly oiled black (e.g. phosphated) and coated (e.g. mech. galv., zinc flake plating) screws and nuts.

Tighten M5 domed cap nuts with a torque of 4.2 Nm.
9 KUKA Service

9.1 Requesting support

Introduction

This documentation provides information on operation and operator control, and provides assistance with troubleshooting. For further assistance, please contact your local KUKA subsidiary.

Information

The following information is required for processing a support request:

• Description of the problem, including information about the duration and frequency of the fault
• As comprehensive information as possible about the hardware and software components of the overall system

The following list gives an indication of the information which is relevant in many cases:

– Model and serial number of the kinematic system, e.g. the manipulator
– Model and serial number of the controller
– Model and serial number of the energy supply system
– Designation and version of the system software
– Designations and versions of other software components or modifications
– Diagnostic package KRCDiag
  Additionally for KUKA Sunrise: existing projects including applications
  For versions of KUKA System Software older than V8: archive of the software (KRCDiag is not yet available here.)
– Application used
– External axes used

9.2 KUKA Customer Support
